Bottle Mails from You

My project is "Bottle Mails from You" which to make an application. This application allows users to exchange a diary with themselves in the future. Users must send their present diary to the future and read a diary from the past. The reason why I want to make this application is that I keep my diary since I was a high school student, but I don't read it back. If I can read it back randomly, it is going to be interesting.

As for the contents of this application, users can write a date, days of a week, and their diary. This application does not limit the topics and basically, users can write whatever they want. The size of a text area is going to be 300 letters, but I want to allow users to add more text area as they need. After users hit a send button, they can read diaries from their past. I want to add a comment area for past diary if it possible.

In the system, firstly, users submit their diary by POST method. As they send data, the application chooses one unread diary randomly and consoles it. At that time, console comment area with diary and

allows users to make a comment. About the maximum letters, I can add an event to add a text area as users hit the "add text-area" button. As for the present, this application needs to have at least two pages to show such as a page for typing a diary and a page for reading past diary. In addition,

At last, I also want to let users add pictures to the diary, but I think it is going to take time. This application will be running on the different type of devices, so it has to share all picture date to exchange over the difference between a device and a device. There is a lot to do to make my application, but I hope I will enjoy them.
